

SPECIALTY APPLIANCES

CLASS II SPECIALTY M4 HERBST

The Specialty M4 Miniscope Herbst is the most popular Herbst mechanism in the market. It allows up to 40 degrees of lateral movement and a maximal incisal opening of up to 64 mm.

The M4 Miniscope Herbst is fully customizable and is often paired with brackets or upper expansion screws. The traditional 12-mm RPE screw provides enough expansion to balance out the lateral dimensions while the Herbst is worn.

The miniscope can be activated without removing it from the mouth; the telescope will not come apart. This low-profile Herbst mechanism offers increased appliance strength and patient comfort.

HIGHLIGHTS

- **Improved patient comfort.** The M4 Miniscope offers greater lateral movement and incisal opening than other Class II appliances.
- **Less breakages and remakes.** This mechanism can be activated without removing it from the mouth, and the telescope will not come apart.
