Clarity Digital Bonding

Clarity Digital Bonding brings digital precision to bracket placement by combining advanced treatment planning with an indirect bonding workflow. Designed to help reduce variability, it supports consistent, digitally planned bracket placement from setup through delivery.

Starting with a patient-specific setup in Clarity Portal, bracket positioning is digitally planned and approved before custom trays are created for full-arch placement in a single step. By helping translate the approved digital setup directly to the clinical appointment, Clarity Digital Bonding supports consistent bracket placement and a more efficient bonding workflow.

When paired with compatible APC Flash-Free Adhesive Brackets, clinicians may reduce the need for adhesive cleanup. The system may be used when clinicians want an indirect bonding workflow

that supports planned bracket positioning, chairside efficiency, and consistency during the initial bonding appointment.

HIGHLIGHTS

- **Efficiency and time savings:** Reported savings of up to 19 minutes per bonding appointment and potential to reduce overall treatment time by up to six months.
- **Fewer adjustments, more consistency:** Reported reduction in repositioning appointments by up to 47% vs. traditional bonding, supporting greater treatment consistency.
- **Simplified, reliable bonding:** No flash to clean up with APC Flash-Free Brackets and reported bond failure rates of less than 2%.
