ORTHOSELECT

DIBS AI

PRECISION BRACKET PLACEMENT FROM ORTHOSELECT

The patented, award-winning Dibs AI software simplifies and automates the process of case setups, creates predictive outcomes based on any bracket prescription, and delivers extremely accurate, 3D-printed indirect bonding (IDB) trays for precision bracket placement. These advancements free up precious chair time by shortening bonding appointments by one-third or more, as well as reducing overall treatment time through significant decreases in the need for wire bending or bracket repositioning.

ADVANCING THE PRACTICE OF DIGITAL BONDING

OrthoSelect continues to introduce new features to the Dibs AI experience to make digital bonding even easier:

- Non-stick trays: The latest IDB trays are virtually stick-free from excess primer or adhesive when removed from patients' teeth. Thanks to Sure-Release Technology, a proprietary advancement developed by OrthoSelect Labs, the bonding process can now be even easier and faster.

- Five-day turnaround: Receive a patient's trays in office in five business days or less—with prescribed brackets preloaded for convenience. Rush cases for next-day delivery are also available.
- DIBS AI Online: DIBS AI is now available online, allowing doctors to approve cases from virtually any computer.

HIGHLIGHTS

- **Highly accurate bracket placement.** The advanced software algorithms and 3D-printing technology provide optimal bracket placement on patients' teeth with an average deviation of only 0.1 mm.
- **Shorter appointment and treatment times.** Doctors report that the speed and simplicity of Dibs AI shortens bonding appointments and the accuracy of bracket placement results in faster treatment times.
- **Lower treatment costs.** The benefits of improved accuracy and time savings can result in a reduction of 25% or more of the orthodontist's cost of treatment.
